The calcaneum and navicular bones carry the front part of the foot. In passive

assessment, hold the ankle in your left hand and the forefoot in your right. Assess:

dorsiflexion ( figure 112a) and plantar flexion ( figure 112b ); inversion ( figure 112c ), when the sole turns inwards, is to 30 degrees and eversion ( figure 112d ) is to 5 degrees.

**[Clinical Examination  
of the Foot]**

A good clinical examination can supplement the history and assist the examiner in making the diagnosis of any problem. Because reproduction of a patient's symptoms is the key to making a correct diagnosis, this article correlates clinical anatomy and

testing with common complaints of the foot and ankle (Figs. 1-4).

Stance, gait, and movement

## **Clinical Examination of the Foot and Ankle**

Inspection of the patient's stance and gait is important.

Normally, the foot passively pronates during the initial ground contact in the early stance phase.

### Examination Of The Foot And Ankle

The clinical exam recommended, however, is designed to identify loss of protective sensation (LOPS) rather than early neuropathy. The diagnosis and management of the latter were covered in a 2004 ADA technical review . The clinical examination to identify LOPS is simple and requires no expensive equipment.
