In railway signalling, an interlocking (IXL) is a system composed by a set of signal apparatus that prevents trains from conflicting movements through only allowing trains to receive authority to proceed, when routes have been set, lock and detected in safe combinations. Principles of Railway interlocking is a huge and hard topic.

Interlocking systems are used for ensuring the safety of trains. This master thesis is made in cooperation with Banedanmark and deals with relay-based interlocking systems for railway stations. The goal of this project is to develop a formal method for verifying that such systems guarantee the safety of trains.

Zone Selective Interlocking (ZSI) is a communication scheme used with electronic trip units and electronic protective relays for circuit breakers to improve the level of protection in a power distribution system. This is achieved through communication between the down- stream and upstream devices in a power distribution system.

In the design of electrical power systems, the ANSI standard device numbers (ANSI /IEEE Standard C37.2 Standard for Electrical Power System Device Function Numbers, Acronyms, and Contact Designations) identifies the features of a protective device such as a relay or circuit breaker. These types of devices protect electrical systems and components from damage when an unwanted event occurs, such ...
